Completely redesigned the project on fiber. Created functions for Order, Payments, Categories, Products:
Changed the login system. Now you need to enter the PIN code in "body" in the login page. Then he will give us a token that we will use to gain access to the products. The token will need to be entered in "headers" on "Authorization".

```go
//Token authenticate
headerToken := c.Get( key: "Authorization")
if headerToken == "" {
    return c.Status( status: 401).JSON(fiber.Map{
        "success": false,
        "message": "Unauthorized",
        "error":   map[string]interface{}{},
    })
}
if err := middleware.AuthenticateToken(middleware.SplitToken(headerToken)); err != nil {
    return c.Status( status: 401).JSON(fiber.Map{
        "success": false,
        "message": "Unauthorized",
        "error":   map[string]interface{}{},
    })
}
//Token authenticate
```
